 UserId="64581" Text="\*\*Try this:\*\*&#xD;&#xA;&#xD;&#xA;1. Make the data stationary (remove trends and seasonality).&#xD;&#xA;2. Implement PACF analysis on the label data (For eg: Load) and find out the optimal lag value. Usually, you need to know how to interpret PACF plots.&#xD;&#xA;3. Apply the sliding window on the whole data (t+o, t-o) where o is the optimal lag value.&#xD;&#xA;4. Apply walk forward validation to train and test the models.&#xD;&#xA;&#xD;&#xA;The way to escape sliding window is to use Recurrent Neural Networks but believe me, the method I suggested is worth it.&#xD;&#xA;&#xD;&#xA;If you want the code:&#xD;&#xA;<https://machinelearningmastery.com/time-series-forecasting-supervised-learning/>&#xD;&#xA;&#xD;&#xA;This can help too: [Master Thesis research applicable to your question] [1]&#xD;&#xA;&#xD;&#xA;&#xD;&#xA; [1]: [http://bth.diva-portal.org/smash/record.jsf?aq2=%5B%5B%5D%5D&amp;c=1&amp;af=%5B%5D&amp;searchType=SIMPLE&amp;sortOrder2=title\\_sort\\_asc&amp;query=aniruddh&amp;language=en&amp;pid=diva2%3A1291227&amp;aq=%5B%5B%5D%5D&amp;sf=all&amp;aqe=%5B%5D&amp;sortOrder=author\\_sort\\_asc&amp;onlyFull](http://bth.diva-portal.org/smash/record.jsf?aq2=%5B%5B%5D%5D&amp;c=1&amp;af=%5B%5D&amp;searchType=SIMPLE&amp;sortOrder2=title_sort_asc&amp;query=aniruddh&amp;language=en&amp;pid=diva2%3A1291227&amp;aq=%5B%5B%5D%5D&amp;sf=all&amp;aqe=%5B%5D&amp;sortOrder=author_sort_asc&amp;onlyFull) --> Word Count (1)

 UserId="41771" Text="Yes, having lots of recorded conversations is great for building a speech recognition system. You will still have to create training samples (Each sample will be parts of Wave file --> text), but you will need lesser number of samples. &#xD;&#xA;&#xD;&#xA;High level steps are :&#xD;&#xA;&#xD;&#xA; 1. Train a GAN on raw audio &#xD;&#xA; 2. Train Language models on raw text data (need not be from these conversations, but has to be from same domain). For example, if conversations are related to medical, train language model on medical text. &#xD;&#xA; 3. Merge these models and train on labeled samples &#xD;&#xA;&#xD;&#xA;For step 1, Google WaveNet is a good example

(it is eventually used for Test-to-Speech, it is a component in Speech-t- -->

 Andrew Ng's classes&#xD;&#xA; - [Machine  
 Learning](https://www.coursera.org/learn/machine-learning) (very good for the  
 maths)&#xD;&#xA; - then go to his [deep learning

class](https://www.coursera.org/specializations/deep-learning) (I haven't done it but I only hear good things from it)&#xD;&#xA;&#xD;&#xA; - Udacity had a very good Data Science Specialisation divided in 4 classes. I don't know if it's still available (I did it two years ago) but it is probably either still there or an improved version has replaced it. The 4 courses where:&#xD;&#xA; - Intro to Data science&#xD;&#xA; - Visualisation&#xD;&#xA; - Machine Learning&#xD;&#xA; - --> Word Count (13)

 expressions](https://en.wikipedia.org/wiki/Regular\_expression) are a powerful

formalism for pattern matching in strings. They are available in a variety of dialects (also known as \*flavors\*) in a number of programming languages and text-processing tools, as well as many specialized applications. The term "Regular expression" is typically abbreviated as "Regex" or "regex".# Further Reading## Learning regular expressions \* [ --> Word Count (451)

 UserId="69822" Comment="rephrasing , corrected spelling" Text="Yes, having lots of recorded conversations is great for building a speech recognition system. You will still have to create training samples (Each sample will be parts of Wave file --> text), but you will need lesser number of samples. &#xD;&#xA;&#xD;&#xA;High level steps are :&#xD;&#xA;&#xD;&#xA; 1. Train a GAN on raw audio &#xD;&#xA; 2. Train a Language model on raw text data (it needs not be from these conversations, but has to be from same domain). For example, if conversations are related to medical, train language model on medical text. &#xD;&#xA; 3. Merge these models and train on labeled samples &#xD;&#xA;&#xD;&#xA;For step 1, Google WaveNet is a good example (it is eventually used for Text-to-Speech, it is a component in Speech-to- --> Word Count (11)

 UserId="52559" Text="I have a dataset that contains around 10000 small  
 paragraphs and the paragraphs belong to classes. There are around 80 - 100  
 classes. The paragraphs can be organized in hierarchies. I want to build a  
 classifier model that will predict the class of an unseen paragraph.  
 &#xD;&#xA;&#xD;&#xA;Currently what I have done is, I have implemented a two step  
 classification using FastText. First I classify the unseen text to a top level  
 class and then using another classifier I classify it to a subclass of the  
 identified top level class. This helped me to increase the accuracy.  
 &#xD;&#xA;&#xD;&#xA;Is there a better way to do this? Is there any good  
 hierarchical classifier like <https://github.com/globality-corp/sklearn-hierarchical-classification>  
 out there for text classification? Or can this be  
 improved using Fast --> Word Count (5)

 UserId="73513" Text="I have two tables of postal address information - the one is about 2 million records, the other roughly 40 million. They have quite bad quality, and also are not quite compatible with each other (different conventions in both sets, some fields cut off in an impractical way... - in other words, Real World data).&#xD;&#xA;&#xD;&#xA;They may not be the largest ones around, but compared to the available hardware, they are non-trivial (I cannot simply spin up a lot of worker nodes, or do a simple  $O(n^2)$  loop...)&#xD;&#xA;&#xD;&#xA;I wish to join-update the two tables on the postal address. Something like&#xD;&#xA;&#xD;&#xA; select table1.id, table2.id&#xD;&#xA; from table1, table2&#xD;&#xA; where fuzzy\_match([table1.street, table1.city, ...], &#xD;&#xA; [table1.street, table1.city, ...]) &gt; \$MINIMUM\_DISTANCE;&#xD;&#xA;&#xD;&#xA;The match is then used to store `table2.id` as a reference in `table1`.&#xD;&#xA;&#xD;&#xA;Obviously this is only pseudo-code. I'm looking for a tool to do this (either some existing solution, or a library to use in our application, or hints towards a non-naive algorithm or data structure to &quot;DIY&quot; it).&#xD;&#xA;&#xD;&#xA;I need to do this at least once/initially over the full data, and then periodically for deltas/updates.&#xD;&#xA;&#xD;&#xA;This is the technical background:&#xD;&#xA;&#xD;&#xA;- Linux server&#xD;&#xA;- Oracle RDBMS&#xD;&#xA;-

The programming environment is primarily Ruby-based, but other tools and languages can be installed if open source.&#xD;&#xA;&#xD;&#xA;I can think of the following options:&#xD;&#xA;&#xD;&#xA;- Oracle --> Word Count (167)

UserId="45264" Text="When you use matplotlib's plot function, it holds an object
behind the scenes for you. You can change this object with more calls to `plt`
and then only once everything has been done should you `plt.show()` the
graph.

Here is a simply example that does what you
want:

 In [1]: import matplotlib.pyplot as plt

In [2]: import numpy as np

 
 In [3]: x = np.linspace(0, 10, 100)

 In [4]: y = x ** 2


The following lines change the plot object, adding the axes
labels - but we don't show it until all are complete...


In [5]: plt.plot(x, y)

 Out[5]: [matplotlib.lines.Line2D at
0x7f3c896bb9b0>]
 
 In [6]:
plt.xlabel('Time')

 Out[6]: Text(0.5, 0, 'Time')
 
 In [7]:
plt.ylabel('Speed')

 Out[7]: --> Word Count (113)

 UserId="68023" Text="If you have a smaller dataset, then I think manual  
 labelling could work.&#xA;&#xA;For larger datasets, you need to use a sentiment  
 analyser engine which has been retained on a very large dataset.&#xA;&#xA;For  
 example, you can use [TextBlob][1], &#xA;&#xA; from textblob import  
 TextBlob&#xA; obj = TextBlob( some\_text )&#xA;&#xA; print(  
 obj.sentiment.polarity )&#xA;&#xA;You can one by one load each review and sort  
 them into three classes or continuous values.&#xA; &#xA; - You can classify the  
 review into a categorical variable. For example, if the polarity is above 0 then  
 the review is positive else it is negative. Here, you will perform  
 classification.&#xA; &#xA; - Use the values from ` --> Word Count (75)

 UserId="74313" Text="\*\*Time-series analysis has two main goals:\*\*&#xD;&#xA;&#xD;&#xA;- To identifying the nature of the phenomenon represented by the sequence of observations, and &#xD;&#xA;- To forecast (predicting future values in time for a variable).&#xD;&#xA;&#xD;&#xA;\*\*NOTE: In this respect, models try to get pattern using historical values. Do not confuse here between forecasting (predicting future values) and prediction.\*\* &#xD;&#xA;&#xD;&#xA;For time-series prediction(forecasting) problems, \*\*the models (ARIMA, LSTM) try to extract trend, seasonality, and residual from the list of historical values\*\* e.g. price from 300 historical dates or time. Therefore, there is no need to look for dependent variables here.&#xD;&#xA;We must be clear, \*\*the time series forecasting algorithm extrapolate historical trend to near and far future.\*\* \*\*They do not predict target variable based on dependent variables.\*\* This is the main reason you will see time-series models only work with single variable who's historical data-points become input and future data points become target. &#xD;&#xA;&#xD;&#xA;\*\*Reference:\*\*&#xD;&#xA;&#xD;&#xA;1. <http://www.statsoft.com/> --> Word Count (1)

UserId="74735" Text="Oh Wow, `textblob`'s default setting can't deal with even a reasonable amount of data.

TL;DR: You do need better control over what the library does.

The class
```

[NaiveBayesClassifier][naive], or more exactly it's superclass [NLTKClassifier][nltk] uses a default for of `feature\_extractor`. In this case it uses [basic\_extractor][base], which, apart from stemming the words in some way (not relevant for us here) it does the following:

```

features = dict(((u'contains({0})'.format(word), (word in tokens))
for word in word_features))
Once per each document
(sample):
[naive]: https://github.com/sloria/TextBlob/blob/dev/textblob/classifiers.py#L289
[nltk]: https://github.com/sloria/TextBlob/blob/dev/textblob/classifiers.py#L188
[base]: https://github.com/sloria/TextBlob/blob/dev/textblob/classifiers.py#L73
Ouch! That will create a python dictionary for every single document. And store in these dictionaries the *term frequency* for each document. On 16k rows (documents/samples) that is very likely to be way too much memory.
On Ubuntu you likely have swap space, which is extra disk space used as memory, your OS figuring out it is out of memory starts swapping pages of memory onto this swap space. Yet, swap space is super slow compared to actual memory, therefore the computation takes forever. And, in the end, it is this swap space and this slowness that keeps the algorithm running forever, instead of overheating your CPU or making the machine completely frozen and out of memory.
Better approach to the problem
ML techniques do not understand words, or strings in general, they only understand numbers. `textblob` hides this fact from you because it performs the feature extraction behind the scenes. That works for toy problems but will likely impair the solution of any more complex problem (be it because of problem complexity or amount of data, or both).
You need to take control of the feature extraction yourself. A Naive Bayes classifier is a rather simple algorithm and will work well with a plethora of extraction techniques. Term Frequency (simply counting the number of each distinct word in every document), will work well enough as long as you do not use expensive python dictionaries to hold the frequencies in memory. But once you get control of your feature extraction there are many more techniques to use: TF-IDF, n-grams. I find the [sklearn]'s explanation of text features very enlightening[sklearn]. But I digress.
[sklearn]: https://scikit-learn.org/stable/modules/feature_extraction.html#text-feature-extraction
For your problem at hand, `textblob` is just a wrapper on top of the [nltk][nltk] library. You can define a feature extractor using `nltk.text.Text`. And then you can pass the resulting feature extractor into the `feature_extractor=` parameter of `NaiveBayesClassifier`. For example:
X, y = [], []
for s, l in csv.reader(fp):
 X.append(s)
 y.append(l)
NaiveBayesClassifier(X, feature_extractor=nltk.text.Text)

UserId="74735" Comment="considerably changed answer, i was wrong on nltk
behaviour" Text="Oh Wow, `textblob`'s default setting can't deal with even a
reasonable amount of data.

*TL;DR: You do need better
control over what the library does.*

The class
[NaiveBayesClassifier][naive], or more exactly it's superclass
[NLTKClassifier][nltk] uses a default for of `feature_extractor`. In this case
it uses [basic_extractor][base], which, apart from stemming the words in some
way (not relevant for us here) it does the following:


features = dict(((u'contains({0})'.format(word), (word in tokens))

for word in word_features))

Once per each document
(sample).

surface, this sounds like a pretty stupid question. However, i've spent the day poking around various sources and can't find an answer. &#xD;&#xA;&#xD;&#xA;Let me make the question more clear. &#xD;&#xA;&#xD;&#xA;Take this classic image: &#xD;&#xA;&#xD;&#xA;[![enter image description here][1]][1]&#xD;&#xA;&#xD;&#xA;Clearly, the input layer is a vector with 3 components. Each of the three components is propagated to the hidden layer. Each neuron, in the hidden layer, sees the same vector with 3 components -- all neurons see the same data. &#xD;&#xA;&#xD;&#xA;So we are at the hidden layer now. From what I read, this layer is normally just ReLus or sigmoids. &#xD;&#xA;&#xD;&#xA;Correct me if I'm wrong, but a ReLu is a ReLu. Why would you need 4 of the exact same function, all seeing the exact same data? &#xD;&#xA;&#xD;&#xA;What makes the red neurons in the hidden layer different from each other? Are they supposed to be different? I haven't read anything about tuning or setting parameters or perturbing different neurons to have them be different. But if they aren't different...then what's the point? &#xD;&#xA;&#xD;&#xA;[ --> Word Count (37)

 UserId="76287" Text="I would like to train test split a list of texts with the  
 associated entities so there are no entities overlapping  
 splits.&#xD;&#xA;&#xD;&#xA;Ensuring no overlaps is challenging: I currently  
 achieve it with 2 groupby operations through `apache beam`. I was wondering if  
 there was a faster or more scalable way of doing this train test  
 split?&#xD;&#xA;&#xD;&#xA;Another way of formulating the question is I am  
 looking for an efficient way to calculate connected components of a  
 graph.&#xD;&#xA;&#xD;&#xA;I have about 7 million documents with 250,000 entities  
 and this dataset is likely to grow in the  
 future.&#xD;&#xA;&#xD;&#xA;&#xD;&#xA;INPUT&#xD;&#xA;&#xD;&#xA; ENTITIES  
 TEXT&#xD;&#xA; e1 TextA&#xD;&#xA; e1, e2 TextB&#xD;&#xA; e3  
 TextC&#xD;&#xA;&#xD;&#xA;I would like to have the  
 outputs:&#xD;&#xA;&#xD;&#xA;TRAIN SPLIT&#xD;&#xA;&#xD;&#xA; ENTITIES  
 TEXT&#xD;&#xA; e1 TextA&#xD;&#xA; e1, e2  
 TextB&#xD;&#xA;&#xD;&#xA;TEST SPLIT&#xD;&#xA;&#xD;&#xA; ENTITIES  
 TEXT&#xD;&#xA; e3 TextC&#xD;&#xA;&#xD;&#xA;MY  
 APPROACH&#xD;&#xA;&#xD;&#xA;Initial groupby entities:&#xD;&#xA;&#xD;&#xA; e1  
 [{&quot;text&quot;:&quot;TextA&quot;;, &quot;entities&quot;:[&quot;e1&quot;]}],  
 {&quot;text&quot;:&quot;TextB&quot;;,  
 &quot;entities&quot;:[&quot;e1&quot;;,&quot;e2&quot;]}}&#xD;&#xA; e2  
 [{&quot;text&quot;:&quot;TextB&quot;;,  
 &quot;entities&quot;:[&quot;e1&quot;;,&quot;e2&quot;]}}&#xD;&#xA; e3  
 [{&quot;text&quot;:&quot;TextC&quot;;,  
 &quot;entities&quot;:[&quot;e3&quot;]}}&#xD;&#xA;&#xD;&#xA;Next I create a

```

cooccurring entity key:

 e1-e2
{""text":"TextA";,
"entities":["e1"]}
 e1-e2
{""text":"TextB";,
"entities":["e1","e2"]}
 e1-e2
{""text":"TextB";,
"entities":["e1","e2"]}
 e3
{""text":"TextC";,
"entities":["e3"]}

I then groupby on this
cooccurring key:

 e1-e2
[{""text":"TextA";, "entities":["e1"]},
{""text":"TextB";,
"entities":["e1","e2"]}]
 e3

UserId="29169" Comment="added 44 characters in body" Text="I am designing an
Orange Widget for facial recognition.

I would like to draw a
rectangle around faces captured in video by setting mouse events with
`cv2.setMouseCallback`. I can capture the video in the image window
(`cv2.namedWindow("image");`) with `cv2.VideoCapture(0)` but I am
unable to call the MouseCallBack function in the image
window.

I am new to Orange widget development and unsure if
the`cv2.setMouseCallback` function can work inside of an OrangeWidget class. Any
suggestions or help would be greatly appreciated.

Here is my
code:

``python
class
MouseCallBackWidget(OWWidget):

 name =
"MouseCallBack"
 # Short widget description

description = "Draw rectangle"
 icon =
"icons/DataSamplerA.svg"

 want_main_area =
False
with a fixed non resizable geometry.

resizing_enabled = False 

 def MouseCallBack(self,event,
x, y, flags, param):
 #global boxRefPt, boxCX, boxCY, boxW,
boxH, click, mode_learn, completed_rect, ix, iy 

 #
check if the left mouse button is clicked.
 if event ==
cv2.EVENT_LBUTTONDOWN: 
 if self.completed_rect
== False: 
 self.boxRefPt = [(x, y)]
record the starting (x, y) coordinate of a new rectangle.

self.ix, self.iy = x, y 

self.click = True 

 # check
if the left mouse button is released. 
 elif event ==
cv2.EVENT_LBUTTONUP: 
 self.boxRefPt.append((x,
y)) # record the ending (x, y) coordinate a new
rectangle.
 self.click = False

 self.completed_rect = True 

self.mode_learn = True

 (x1, y1) =
self.boxRefPt[0]
 (x2, y2) =
self.boxRefPt[1]

 self.boxCX = min(x1, x2)

 self.boxCY = min(y1, y2)
 self.boxW =
abs(x1 - x2)
 self.boxH = abs(y1 - y2)


def __init__(self):


super().__init__()

 from AnyQt.QtGui import
QIntValidator

 self.boxRefPt = []

```

```

self.click = False
 self.mode_learn = False

self.completed_rect = False

 self.ix = 0

self.iy = 0
 self.boxCX = 0
 self.boxCY =
0
 self.boxW = 0
 self.boxH =
0

 self.cap = cv2.VideoCapture(0)

cv2.namedWindow("image")


cv2.setMouseCallback("image", self.MouseCallBack)


 while (True):


self.ret, self.frame = self.cap.read()

 if
self.completed_rect == True:


cv2.rectangle(self.frame, self.boxRefPt[0], self.boxRefPt[1], (0, 255, 0),
2)

 UserId="67325" Text="\*\*Problem\*\* : Document classification of scanned financial documents using Text (OCR on the images) and Images. The documents are both structural (forms, tables), unstructured (letters, descriptions, paragraphs of text) and semi-structured (may have paragraphs and forms in the same page).&#xD;&#xA;&#xD;&#xA;\*\*Research Direction\*\* : The idea is to create a multi-model pipeline which uses text data (\_possible models : word2vec, doc2vec

or LSTM/RNN\_), images (\_possible model: CNN\_) and connects the models in a coherent and \*\*\*mutually differentiable\*\*\* way that, one model (say image model) tries to learn better when the other model(text model) is not able to learn and contributes towards the right classification (changing weights doesn't effect loss).

Normal approach adopted for multi-model training:

1. Train both (text and image) models separately and get an output vector for each.
2. Concatenate both vectors and train a Fully-Connected NN with a softmax layer at the end (document classes).

[[enter image description here][1]][1]

**Limitation** (in my case): When the FC-NN is trained, the back-propagation is only limited up-till the start of the FC-NN. Which means that the two models (text and image) are not updated (weights are not updated in both models based on the error evaluated by the loss function in the FC-NN).

**Proposed Approach**

1. Have a pipeline of three models, where image and text models are connected with a FC-NN at the end. But in this case, the loss evaluated in FC-NN is back-propagated upto the input of the image and text models. (See the following image)
2. Image and --> Word Count (123)

UserId="77764" Text="I have an existing database with User stories (with multiple text fields like Description with Use cases, acceptance criteria etc) and corresponding test cases with steps for each test case.  
 &#xD;&#xA;&#xD;&#xA;I am fairly new to data science in general, and I'm wondering if it is possible to use machine learning/natural language processing to **generate** test cases. I wanted to say **predict** test cases, since the algorithm should learn from existing historical data, but predicting sentences sounds counter-intuitive.&#xD;&#xA; &#xD;&#xA;Basically, we need to teach the machine to understand the relation between stories and the corresponding test cases, then given a new user story, generate test case. But here's a catch, it should search in the existing database for similar stories, and if greater than a threshold similarity metric, return the existing test case, else generate new.&#xD;&#xA;&#xD;&#xA;So, I started in the direction of NLU & NLG techniques, I have extracted keywords using TF-IDF scores, build a vocab and then use --> Word Count (59)

 UserId="64377" Text="As far as I know [topic segmentation][1] is not a particularly easy task with clean data, so it's likely to be challenging with noisy old French. &#xD;&#xA;&#xD;&#xA;It's not exactly the same problem so I'm not sure if this is useful but you might want to look into using stylistic features in order to help the model detect the changes between articles. There has been a fair amount of work on the task of \*style change detection\* as part of the [PAN series][2] (the task has run for 3 years, results and papers are available from the previous years).&#xD;&#xA;&#xD;&#xA;Hope this helps.&#xD;&#xA;&#xD;&#xA;&#xD;&#xA; [1]: <https://en.wikipedia.org/wiki/> --> Word Count (4)

 UserId="79249" Text="Since (word-based) one-hot encoding and real-valued vector representations are already mentioned in the question, I would only add the n-gram representation, especially the character-based n-gram representation.&#xD;&#xA;&#xD;&#xA;For word-based [n-gram representations][1] you consider not individual words, but their ordered combinations in the text and use the one-hot encoding for the combinations. E.g. for n=2 you might end up with the bigrams [‘John likes’, ‘likes to’, ‘to watch’, ‘watch movies’] and each of them would be assigned to some dimension using a static index.&#xD;&#xA;&#xD;&#xA;This also works with characters, so you can represent the word ‘encoding’ e.g. with those 3-grams: [‘enc’, ‘nco’, ‘cod’, ‘odi’, ‘din’, ‘ing’]. This is especially useful for languages with rich [morphology][2] and/or [compound][3] words. In a one-hot representation each single word form would be encoded in its own dimension where a character n-gram approach might help preserve similarity between different forms. An example in the English language would be the similarity between ‘encode’, ‘encoded’ and ‘encoding’ which would stay preserved this way. Similar techniques are used also by some word embedding algorithms which consider subword information like e.g. [Fast --> Word Count

 UserId="51714" Text="It's quite a weird problem, at least for me... Following your approach you'll end up with  $5^5$  classes, which is an intractable problem with typical Neural Networks. You can visist this paper, which shows a solution with mathematical rigour:  
<https://arxiv.org/pdf/1806.02507.pdf>  
 I'll also expose three possible naive solutions, awating for people who have faced a similar problem: Convert your 5 columns into binary columns (3 bits for 5 levels) and treat the problem as a multi-label classification with 15 classes [https://en.wikipedia.org/wiki/Multi-label\\_classification](https://en.wikipedia.org/wiki/Multi-label_classification).  
 You can fit 5 multi-class models for each column (divide

and conquer naive approach, it seems to be the state-of-the art  
 phylosophy)&#xD;&#xA;&#xD;&#xA;\* Treat your problem as a regression problem, but  
 some questions arise: is '11111' truly close to '11112' in your dataset? i.e.  
 are your labels a ordered set?&#xD;&#xA;&#xD;&#xA;&gt; So my question is if I  
 should go on with the approach or are there better ideas? It is possible to use  
 ANN to predict several properties (i.e. classes) at the same  
 time?&#xD;&#xA;&#xD;&#xA;Yes, an ANN can output more than one class for a sample  
 (but will not work in such a large scale): &#xD;&#xA;&#xD;&#xA;\* [https://www.researchgate.net/publication/3297607\\_Multilabel\\_Neural\\_Networks\\_with\\_Applications\\_t

 &#xD;&#xA;&#xD;&#xA;\* You can fit 5 multi-class models for each column (divide  
 and conquer naive approach, it seems to be the state-of-the art  
 phylosophy)&#xD;&#xA;&#xD;&#xA;\* I've never tried beta-regression, but it would  
 make sense: you can convert your target labels to frequencies of occurrence,  
 think about pruning targets with really low probability. Then, you can perform a  
 preliminary beta regression to predict the occurrence-target. Further on, you  
 may have other classification models depending on the probability given by the  
 beta regressor, let's say 5 models for targets between 0-10%, 10-20% and so  
 on...&#xD;&#xA;&#xD;&#xA;\* Treat your problem as a regression problem, but some  
 questions arise: is '11111' truly close to '11112' in your dataset? i.e. are

What is the best strategy to build a deep learning model to extract this information automatically? Does it make sense to use something like YOLO to recognize specific parts of the image and then Tesseract to actually perform OCR? A bit of guidance would be much appreciated. Also, I have seen things like Amazon" --> Word Count (18)

 UserId="45264" Text="Trying to find certain things in text can be done quite easily if you have the real text, and not a scanned document that is a PDF or even an image. This is actually quite a big topic and can become quite difficult.&#xD;&#xA;&#xD;&#xA;## Pure text&#xD;&#xA;If you have pure text, you can parse out parts you need using custom regular expressions, e.g. to find a date, you might use this:&#xD;&#xA;&#xD;&#xA; ^((19|20)\d\d[- /.](0[1-9]|1[012])[- /.](0[1-9]|1[12][0-9]|3[01]))\$&#xD;&#xA;&#xD;&#xA;&#xA;&#xA; matches a date in yyyy-mm-dd format from 1900-01-01 through 2099-12-31, with a choice of four separators ([source][1]).&#xD;&#xA;&#xD;&#xA;I believe there are even a few libraries that specifically find dates for you within text.&#xD;&#xA;&#xD;&#xA;## PDF&#xD;&#xA;There are actually many types of PDF, i.e. there are many ways a pdf can be encoded behind the scenes. Some types are easier to parse than others, but luckily there are libraries that can help with that. For example, check out [PDFMiner][2].&#xD;&#xA;&#xD;&#xA;After using such

a library, you will hopefully be left with the pure text, and can maybe go back to using methods from that section.

Images  
If you are unlucky enough to have an image as a starting point, then you are now in the realms of OCR - **Optical Character Recognition**. I would recommend reading [this blog post][3] for a more complete description of possible methods, but in a nutshell, you can try using either:  
1. a traditional algorithm from computer vision (applying filters and looking for edges etc.)  
2. a trained model specialised for text (e.g. **EAST: an Efficient and Accurate Scene** --> Word Count (75))

UserId="69470" Text="You are passing the variable `text` (where you stored the
`nlTK.Text` object) to `re.sub` (which expects a string `str` object, not a
`nlTK.Text` object).

Contrary to what that class's name may
suggest, `Text` is not a string-like object itself, it simply **stores**
strings. That may be what misled you.

Those strings are
probably what you need when calling the `re`-related functionality below. You
can access them normally and in a pythonic via standard enumeration methods,
e.g. `for`-looping over that instance, `for word in theText...`. See the code
below for a full example.


 import re

import random
 from nltk.text import Text
 

Initialize a dummy text with integers as its words.
 # With random
probability, we add a non-alphanumeric 
 # character to the word so
that we can test the regular
 # expression in the original
example.
 text = Text([
 str(random.randrange(1,
100)) + (
 '' if random.random() >= 0.5 else 

random.choice(['!', ', ', '?', ':', ';'])
)
 for
_ in range(20)
])
 
 # The tokens in the
`Text` object can be accessed
 # via enumeration (the class
implements a Python iterator
 # underlyingly)

print(text)
 print(text.tokens[:10])

print(list(text)[:10])
 print([x for x in text][:10])


 # To avoid the exception, we comment the original line

We can't pass the variable `text` to `re.sub` because
 # it
expects a string and `text` stores an instance of 
 # NLTK's `-->
